Notes:

- 1) “Background Information, 2005 Review Conference of the Parties to the Treaty on the Non-Proliferation of Nuclear Weapons,” United Nations, Retrieved 2006-07-02.
- 2) Brower, Kenneth S., “A Propensity for Conflict: Potential Scenarios and Outcomes of War in the Middle East,” Jane’s Intelligence Review, Special Report no. 14 (February 1997), p. 14-15.
- 3) “Nuclear Weapons: Who Has What at a Glance,” Arms Control Association, Retrieved 2007-05-30.
- 4) The Bulletin of the Atomic Scientists puts the Israeli nuclear stockpile at 60-80 but notes that it is believed that Israel has produced nuclear material enough for 115-190 warheads.
- 5) In 1986, Mordechai Vanunu, a former technician at Dimona, revealed to the media some evidence of Israel’s nuclear program. Israeli agents abducted him from Italy and transported him to Israel. An Israeli court then tried him in secret on charges of treason and espionage, and sentences him to 18 years imprisonment. At the time of Vanunu’s arrest, *The Times* reported that Israel had material for approximately 20 hydrogen bombs and 200 fission bombs. If we take this information at face value, by now Israel should have material for considerably more nuclear bombs and that seems to corroborate the opinion of the sources from Notes [1], [2], [3] that Israel now may have up to 400 nuclear weapons.
- 6) Vanunu’s information in October 1986 said that based on a reactor operating at 150 megawatts Israel produces 40 kg of plutonium per year. Israel possesses a 200 kg warhead, containing 6 kg of plutonium (Farr, Warner D. *The Third Temple’s Holy of Holies: Israel’s Nuclear Weapons*, USAF Counterproliferation Center, September 1999, Retrieved 2007-07-03). During 36 years after 1986 until 2022, Israel could have produced  $36 \times 40 = 1,440$  kg of plutonium; divided by 6, it gives us 240 warheads; plus 220 warheads, which, according to Vanunu, Israel already had in 1986, we receive a possible number of Israel’s warheads now at 460.
- 7) The substantial discrepancy over data about Israel (between the Bulletin of the Atomic Scientists and the

Stockholm International Peace Research Institute on one side and the International Institute for Strategic Studies, Jane's Defense Weekly, and sources from the notes [1], [2], [3] on the other side) may be explained by the following:

7.1) "Israel's nuclear weapons are not believed to be fully operational under normal circumstances" (Bulletin of the Atomic Scientists, article "Nuclear Notebook: Worldwide deployment of nuclear weapons, 2009").

7.2) As Zbigniew Brzezinski stated on Book TV in 2009, Israel had acquired a second-strike capability.

7.3) The opinion of Brzezinski is supported by other less prominent sources stating that Israel's nuclear weapons can now be launched from land, sea and air (Douglas Frantz, Israel Adds Fuel to Nuclear Dispute, Officials confirm that the nation can now launch atomic weapons from land, sea and air, Los Angeles Times, Sunday, October 12, 2003). This gives Israel a second strike option even if much of the country is destroyed (David Eberhart, Samson Option: Israel's Plan to Prevent Mass Destruction Attacks, NewsMax.Com, October 16, 2001).

7.4) The second strike strategy may mean that at any given time some of Israel's nuclear weapons are in storage.

## Notes.

- 1) Most of highly-enriched material is 90-93% enriched uranium-235 (U-235), which is typically considered as weapon-grade. The estimates are in effect for the start of 2021. Important exceptions are noted.
- 2) The uncertainty in the estimate for France applies only to the military stockpile of about 25 tons and does not apply to the declared civilian stock. A 2014 analysis offers grounds for a significantly lower estimate of the stockpile of weapon-grade HEU (as large as  $10 \pm 2$  tons or as low as  $6 \pm 2$  tons), based on evidence that the Pierrelatte enrichment plant may have had both a much shorter effective period of operation and a smaller weapon-grade HEU production capacity than previously assumed.
- 3) France's HEU stockpile includes 5.4 tons declared as civilian. This figure is from France's INFCIRC/549 declaration to the International Atomic Energy Agency (IAEA) for the start of 2020.
- 4) It is believed that India is producing HEU (enriched to 30-45%) for use as naval reactor fuel. The estimate is for HEU enriched to 30%.
- 5) The data for Iran is the International Atomic Energy's (IAEA) estimate as of November 5, 2021. Iran started enriching uranium up to 20% on January 4, 2021 and started enriching HEU up to 60% enrichment level on

April 17, 2021.

- 6) Israel may have acquired 300 kg of weapon-grade HEU from the USA in or before 1965. Some of this material may have been consumed in the process of producing tritium.
- 7) North Korea is known to have a uranium enrichment plant at Yongbyon and possibly others elsewhere. Independent estimates of uranium enrichment capability and possible HEU production extrapolated to the end of 2019 suggest an accumulated HEU stockpile range of 230-1180 kg.
- 8) The estimate for Pakistan assumes total HEU production of 4.1 tons, of which about 100 kg was used in nuclear weapons tests.
- 9) For Russia the estimate is for the amount of 90% enriched uranium that would contain all U-235 in HEU. The actual amount of HEU might be different. It assumes that the Soviet Union stopped all HEU production in 1988. It may therefore understate the amount of HEU in Russia, since the Soviet Union stopped production of HEU for weapons in 1988 but kept producing HEU for civilian and non-weapon military uses, and Russia continues this practice. The material in discharged naval cores is not included in the current stock since the enrichment of uranium in these cores is believed to be less than 20 percent U-235.
- 10) The estimate for the United Kingdom reflects a UK declaration of 21.9 tons of HEU as of March 31, 2002, the average enrichment of which was not given. As the United Kingdom continues to use HEU in naval reactors, the value contains an increasing fraction of spent naval fuel. In 2018 about 500 kg HEU from the UK were transferred to the USA for down blending into low-enriched uranium.
- 11) The amount of the United States HEU is given in actual tons, not 93% enriched equivalent. In 2016, the United States has declared that, as of September 30, 2013 its HEU inventory was 585.6 tons, of which 499.4 tons was declared to be for “national security or non-national security programs including nuclear weapons, naval propulsion, nuclear energy, and science”. This material was estimated to include 360.9 tons of HEU in weapons and available for weapons, 121.1 tons of HEU reserved for naval fuel and 17.3 tons of HEU reserved for research reactors. The remaining 86.2 tons was composed of 41.6 tons “available for potential down-blend to low enriched uranium or, if not possible, disposal as low-level waste”, and 44.6 tons in spent reactor fuel. As of the end of 2020, the amount available for use had been reduced to about 472.1 tons, which is estimated to include 96 tons of HEU in naval reserve and 15.2 tons reserved for research reactors. Between the end of the U.S. financial year (FY) 2013 (September 30, 2013) and the end of FY 2020 (September 30, 2020), the amount of material to be down blended was reduced from 41.6 tons to 23 tons.
- 12) The 2020 IAEA Annual Report lists 156 significant quantities of HEU under comprehensive safeguards in non-nuclear weapon states as of the end of 2020. Assuming a significant quantity to be 25 kg of HEU, the total mass is estimated to be 4 tons. In INFCIRC/912 (from 2017) more than 20 states have committed to reducing HEU stocks and providing regular reports. So far, only 2 states have reported under this scheme. At the end of 2018 (time of last declaration), Norway held less than 4 kg of HEU for civilian purposes. As of June 30, 2019, Australia held 2.7 kg of HEU for civilian purposes.
- 13) Totals are rounded to the nearest 5 tons.

TOTALS	~140	...

## Notes.

- 1) The estimates are for the start of 2021.
- 2) The data for France, Japan, Russia, and the United Kingdom is for the end of 2020, reflecting their most recent INFCIRC/549 declaration. Some countries with civilian plutonium stocks do not submit an INFCIRC/549 declaration to the International Atomic Energy Agency (IAEA). Of these countries, Italy, the Netherlands, Spain and Sweden store their plutonium abroad.
- 3) The numbers for China are based on China's INFCIRC/549 declaration to the IAEA for the end of 2016. As of May 2022, this is the most recent declaration.
- 4) As part of the 2005 Indian-US Civil Nuclear Cooperation Initiative, India has included in the military sector

much of the plutonium separated from its spent power-reactor fuel. While it is labeled civilian here since it is intended for breeder reactor fuel, this plutonium was not placed under safeguards in the 'India-specific' safeguards agreement signed by the Indian government and the IAEA on February 2, 2009. India does not submit an INFCIRC/549 declaration to the IAEA.

- 5) Israel is believed to still be operating the Dimona plutonium production reactor but may be using it primarily for tritium production (tritium is an important component in nuclear weapons; it is used to enhance the efficiency and yield of fission bombs and the fission stages of hydrogen bombs in a process known as "boosting" as well as in external neutron initiators for such weapons). The estimate is for the end of 2020.
- 6) North Korea reportedly declared plutonium production of 37 kg in June 2008. It is believed that it subsequently unloaded its 5-Mwe reactor 3 additional times, in 2009, 2016 and 2018. The stockpile estimate has been reduced to account for the 6 nuclear tests conducted by the country. North Korea's reprocessing facility operated gain in 2021 for five months.
- 7) As of the end of 2020, Pakistan was operating 4 plutonium production reactors at its Khushab site. This estimate assumes that in 2017 Pakistan is separating plutonium from the cooled spent fuel from all 4 reactors.
- 8) For Russia, the material includes 63.3 tons of separated plutonium declared in Russia's 2021 INFCIRC/549 declaration as civilian. Russia does not make the plutonium it reports as civilian available to IAEA safeguards. This amount includes 25 tons of weapon-origin plutonium stored at the Mayak Fissile Material Storage Facility, which Russia pledged not to use for military purposes. The material not available for weapons and monitored under safeguards includes 15 tons of weapons-grade plutonium produced between January 1, 1995, and April 15, 2010, when the last plutonium production reactor was shut down. It cannot be used for weapon purposes under the terms of a 1997 Russian-United States agreement on plutonium production reactors. The material is currently stored at Zheleznogorsk and is subject to monitoring by the United States inspectors.
- 9) In 2012 the United States declared a government-owned plutonium inventory of 95.4 tons as of September 30, 2009. In its 2021 INFCIRC/549 declaration, the most recent submitted, the United States declared 49.4 tons of unirradiated plutonium (both separated and in mixed oxide, MOX) as part of the stock identified as excess for military purposes (declaration for December 31, 2020). The United States placed about 3 tons of its excess plutonium, stored at the K-Area Material Storage facility at the Savannah River, under IAEA safeguards.
- 10) The estimates for other, non-nuclear power, states are done by reconciling the amounts of plutonium declared as "held in locations in other countries" and "belonging to foreign bodies" in the INFCIRC/549 reports.
- 11) The totals are rounded to the nearest 5 tons.
