- 2) Brower, Kenneth S., “A Propensity for Conflict: Potential Scenarios and Outcomes of War in the Middle East,” Jane’s Intelligence Review, Special Report no. 14 (February 1997), p. 14-15.
- 3) “Nuclear Weapons: Who Has What at a Glance,” Arms Control Association, Retrieved 2007-05-30.
- 4) The Bulletin of the Atomic Scientists puts the Israeli nuclear stockpile at 60-80 but notes that it is believed that Israel has produced nuclear material enough for 115-190 warheads.
- 5) In 1986, Mordechai Vanunu, a former technician at Dimona, revealed to the media some evidence of Israel’s nuclear program. Israeli agents abducted him from Italy and transported him to Israel. An Israeli court then tried him in secret on charges of treason and espionage, and sentences him to 18 years imprisonment. At the time of Vanunu’s arrest, *The Times* reported that Israel had material for approximately 20 hydrogen bombs and 200 fission bombs. If we take this information at face value, by now Israel should have material for considerably more nuclear bombs and that seems to corroborate the opinion of the sources from Notes [1], [2], [3] that Israel now may have up to 400 nuclear weapons.
- 6) Vanunu’s information in October 1986 said that based on a reactor operating at 150 megawatts Israel produces 40 kg of plutonium per year. Israel possesses a 200 kg warhead, containing 6 kg of plutonium (Farr, Warner D. *The Third Temple’s Holy of Holies: Israel’s Nuclear Weapons*, USAF Counterproliferation Center, September 1999, Retrieved 2007-07-03). During 32 years after 1986 until 2018, Israel could have produced  $32 \times 40 = 1,280$  kg of plutonium; divided by 6, it gives us 213 warheads; plus 220 warheads, which, according to Vanunu, Israel already had in 1986, we receive a possible number of Israel’s warheads now at 433.
- 7) The substantial discrepancy over data about Israel (between the Bulletin of the Atomic Scientists and the

Stockholm International Peace Research Institute on one side and the International Institute for Strategic Studies, Jane's Defense Weekly, and sources from the notes [1], [2], [3] on the other side) may be explained by the following:

7.1) "Israel's nuclear weapons are not believed to be fully operational under normal circumstances" (Bulletin of the Atomic Scientists, article "Nuclear Notebook: Worldwide deployment of nuclear weapons, 2009").

7.2) As Zbigniew Brzezinski stated on Book TV in 2009, Israel had acquired a second-strike capability.

7.3) The opinion of Brzezinski is supported by other less prominent sources stating that Israel's nuclear weapons can now be launched from land, sea and air (Douglas Frantz, Israel Adds Fuel to Nuclear Dispute, Officials confirm that the nation can now launch atomic weapons from land, sea and air, Los Angeles Times, Sunday, October 12, 2003). This gives Israel a second strike option even if much of the country is destroyed (David Eberhart, Samson Option: Israel's Plan to Prevent Mass Destruction Attacks, NewsMax.Com, October 16, 2001).

7.4) The second strike strategy may mean that at any given time some of Israel's nuclear weapons are in storage.

Uzbekistan	0.01-0.1
TOTAL	~1340

## Notes.

- 1) Most of highly-enriched material is 90-93% enriched uranium-235 (U-235), which is typically considered as weapon-grade. The estimates are in effect for the end of 2017. Important exceptions are noted.
- 2) The uncertainty in the estimate for France applies only to the military stockpile of about 25 tons and does not apply to the declared civilian stock. A 2014 analysis offers grounds for a significantly lower estimate of the stockpile of weapon-grade HEU (as large as  $10 \pm 2$  tons or as low as  $6 \pm 2$  tons), based on evidence that the Pierrelatte enrichment plant may have had both a much shorter effective period of operation and a smaller weapon-grade HEU production capacity than previously assumed.
- 3) France's HEU stockpile includes 5.1 tons declared as civilian. As of January 2019, no INFCIRC/549 declaration on HEU stocks had been submitted to the International Atomic Energy Agency (IAEA) for the end of 2018 and treated as applicable for the start 2019.
- 4) It is believed that India is producing HEU (enriched to 30-45%) for use as naval reactor fuel. The estimate is for HEU enriched to 30%.
- 5) Israel may have acquired 300 kg of weapon-grade HEU from the USA in or before 1965.

- 6) North Korea is known to have a uranium enrichment plant at Yongbyon and possibly others elsewhere. Independent estimates of uranium enrichment capability and possible HEU production extrapolated to the end of 2018 suggest an accumulated HEU stockpile range of 180-850 kg.
- 7) For Russia the estimate may understate the amount of HEU since it assumes that Russia ceased production of all HEU in 1988. However, Russia may have continued producing HEU for civilian and non-weapon military uses after that date. The material in discharged naval cores is not included in the current stock since the enrichment of uranium in these cores is believed to be less than 20 percent U-235.
- 8) The estimate for the United Kingdom reflects a UK declaration of 21.9 tons of HEU as of March 31, 2002, the average enrichment of which was not given. As the United Kingdom continues to use HEU in naval reactors, the value contains an increasing fraction of spent naval fuel. In 2018 about 500 kg HEU from the UK were transferred to the USA for down blending into low-enriched uranium.
- 9) The amount of the United States HEU is given in actual tons, not 93% enriched equivalent. In 2016, the United States has declared that, as of September 30, 2013 its HEU inventory was 585.6 tons, of which 499.4 tons was declared to be for “national security or non-national security programs including nuclear weapons, naval propulsion, nuclear energy, and science”. The remaining 86.2 tons was composed of 41.6 tons “available for potential down-blend to low enriched uranium or, if not possible, disposal as low-level waste”, and 44.6 tons in spent reactor fuel. As of the end of September 2018, another 17 tons had been down blended or shipped for blending down. The amount available for use had been reduced to about 480 tons, mostly by consumption in naval reactors. The 85 tons declared excess includes the remaining about 69 tons as well as 20 tons of originally reserved for HEU fuel for research reactors.
- 10) The 2018 IAEA Annual Report lists 160 significant quantities of HEU under comprehensive safeguards in non-nuclear weapon states as of the end of 2018. In order to reflect the uncertainty in the enrichment levels of this material, mostly in research reactor fuel, a total of 15 tons of HEU is assumed. About 10 tons of this is in Kazakhstan and has been irradiated; it was initially slightly higher than 20%-enriched fuel. It is possible this material is no longer HEU.
- 11) Totals are rounded to the nearest 5 tons.

## Notes.

- 1) The data for France, Japan, Russia, the United Kingdom and the United States is for the end of 2018, reflecting their most recent INFCIRC/549 declaration. Some countries with civilian plutonium stocks do not submit an INFCIRC/549 declaration to the International Atomic Energy Agency (IAEA). Of these countries, Italy, the Netherlands, Spain and Sweden store their plutonium abroad.
- 2) As of March 2020, China had not submitted IAEA INFCIRC/549 declarations for the end of 2017, nor for the end of 2018. The number for civilian stocks is based on the 2016 declaration.
- 3) As part of the 2005 Indian-US Civil Nuclear Cooperation Initiative, India has included in the military sector much of the plutonium separated from its spent power-reactor fuel. While it is labeled civilian here since it

is intended for breeder reactor fuel, this plutonium was not placed under safeguards in the 'India-specific' safeguards agreement signed by the Indian government and the IAEA on February 2, 2009. India does not submit an IAEA INFCIRC/549 declaration.

- 4) Israel is believed to still be operating the Dimona plutonium production reactor but may be using it primarily for tritium production (tritium is an important component in nuclear weapons; it is used to enhance the efficiency and yield of fission bombs and the fission stages of hydrogen bombs in a process known as "boosting" as well as in external neutron initiators for such weapons). The estimate is for the end of 2018.
- 5) North Korea reportedly declared plutonium production of 37 kg in June 2008. It resumed production in 2009, but has probably expended some material in the nuclear tests conducted since then. It is believed to have separated up to 8 kg of plutonium in 2016. An additional 10-14 kg of plutonium may be irradiated fuel unloaded in December 2018 and is not included here.
- 6) As of the end of 2018, Pakistan was operating 4 plutonium production reactors at its Khushab site. This estimate assumes that in 2017 Pakistan is separating plutonium from the cooled spent fuel from all 4 reactors.
- 7) For Russia, the 40 tons of plutonium not available for weapons comprises 25 tons of weapon-origin plutonium stored at the Mayak Fissile Material Storage Facility and about 15 tons of weapon-grade plutonium produced between January 1, 1995 and April 15, 2010, when the last plutonium production reactor was shut down. The post-1994 plutonium, which is currently stored at Zheleznogorsk, cannot be used for weapon purposes under the terms of the U.S.-Russian agreement on plutonium production reactors signed in 1997. Russia made a commitment to eliminate 34 tons of that material (including all 25 tons of plutonium stored at Mayak) as part of the U.S.-Russian Plutonium Management and Disposition Agreement, concluded in 2000. Russia does not include the plutonium that is not available for weapons in its INFCIRC/549 statement; nor does it make the plutonium it reports as civilian available to IAEA safeguards.
- 8) In 2012, the United States declared a government-owned plutonium inventory of 95.4 tons as of the September 30, 2009. In its 2019 IAEA INFCIRC/549 declaration, the most recent submitted, the United States declared 49.3 tons of unirradiated plutonium (both separated and in mixed oxide, MOX) as part of the stock that was identified as excess for military purposes. Since most of this material is stored in classified form, it is considered military stock. The USA considers a total of 61.5 tons of plutonium as declared excess to national security needs.
- 9) The United States placed about 3 tons of its excess plutonium, stored at the K-Area Material Storage facility at the Savannah River, under IAEA safeguards. In addition, it reported that 4.6 tons of plutonium was contained in irradiated MOX fuel, and also declared 0.4 tons of plutonium brought to the United States in 2016 from Japan, Germany and Switzerland (331 kg, 30 kg, and 18 kg, respectively). All this material is considered civilian.
- 10) The estimates for other, non-nuclear power, states are done by reconciling the amounts of plutonium declared as "held in locations in other countries" and "belonging to foreign bodies" in the INFCIRC/549 reports.
- 11) The totals are rounded to the nearest 5 tons.
